

# Spatial Transcriptomics: background and promise

Dr Susan Heavey  
Centre for 3D Models of Health and Disease  
University College London

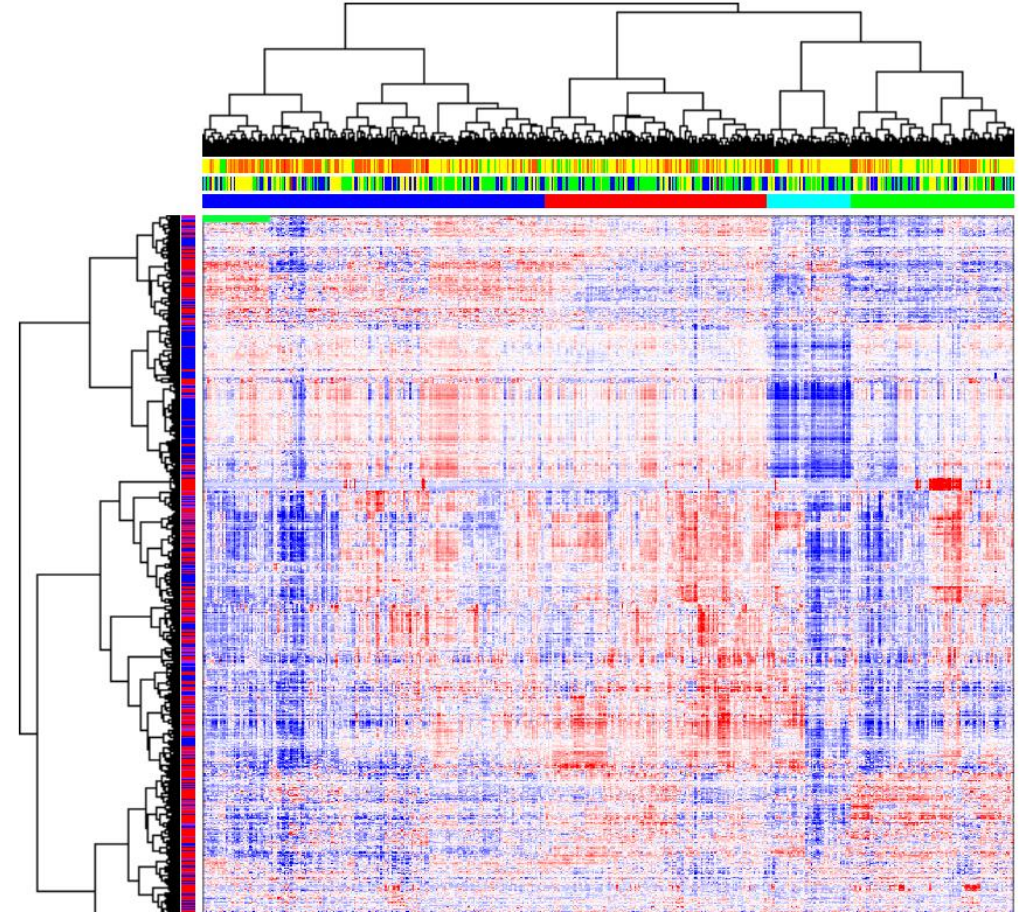

# About me

- Lecturer in Translational Medicine, Centre for 3D Models of Health and Disease, UCL
- Previously Trinity College Dublin, Cold Spring Harbour Laboratory (USA)
- Interested in using human tissue to test new treatments for cancer
- [s.heavey@ucl.ac.uk](mailto:s.heavey@ucl.ac.uk) / [@susan\\_heavey](https://twitter.com/susan_heavey)

# Spatial Transcriptomics

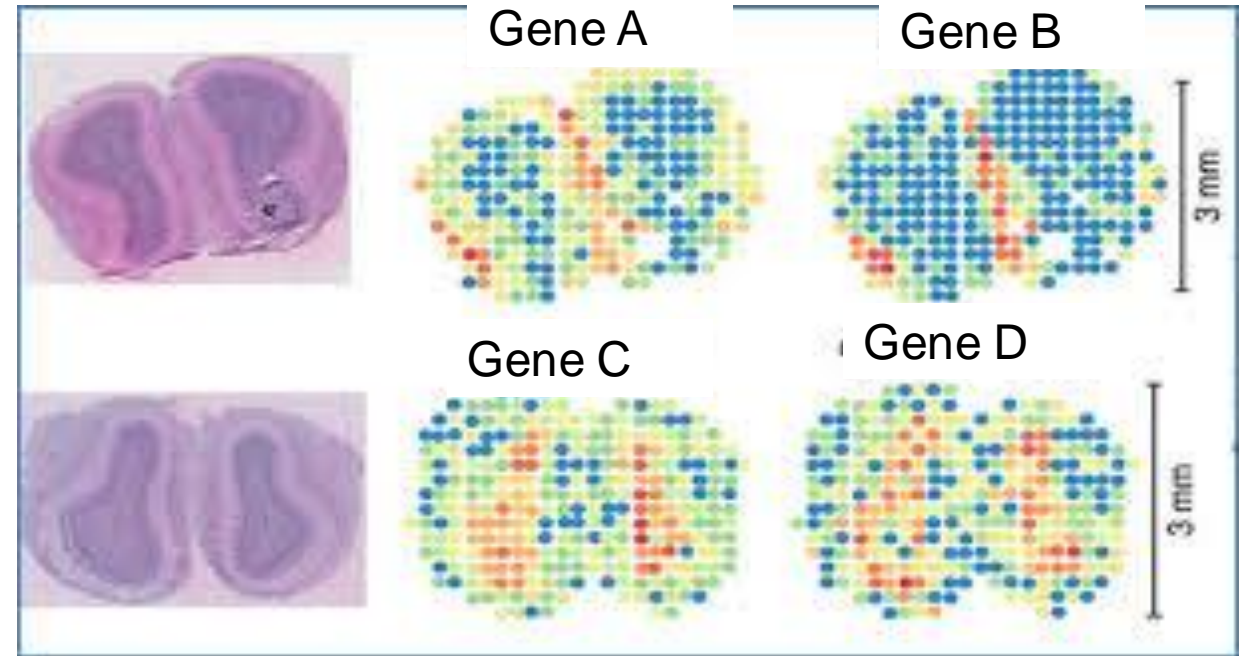

TCGA Firehose data, prostate adenocarcinoma

# Next Generation Sequencing vs Spatial Transcriptomics

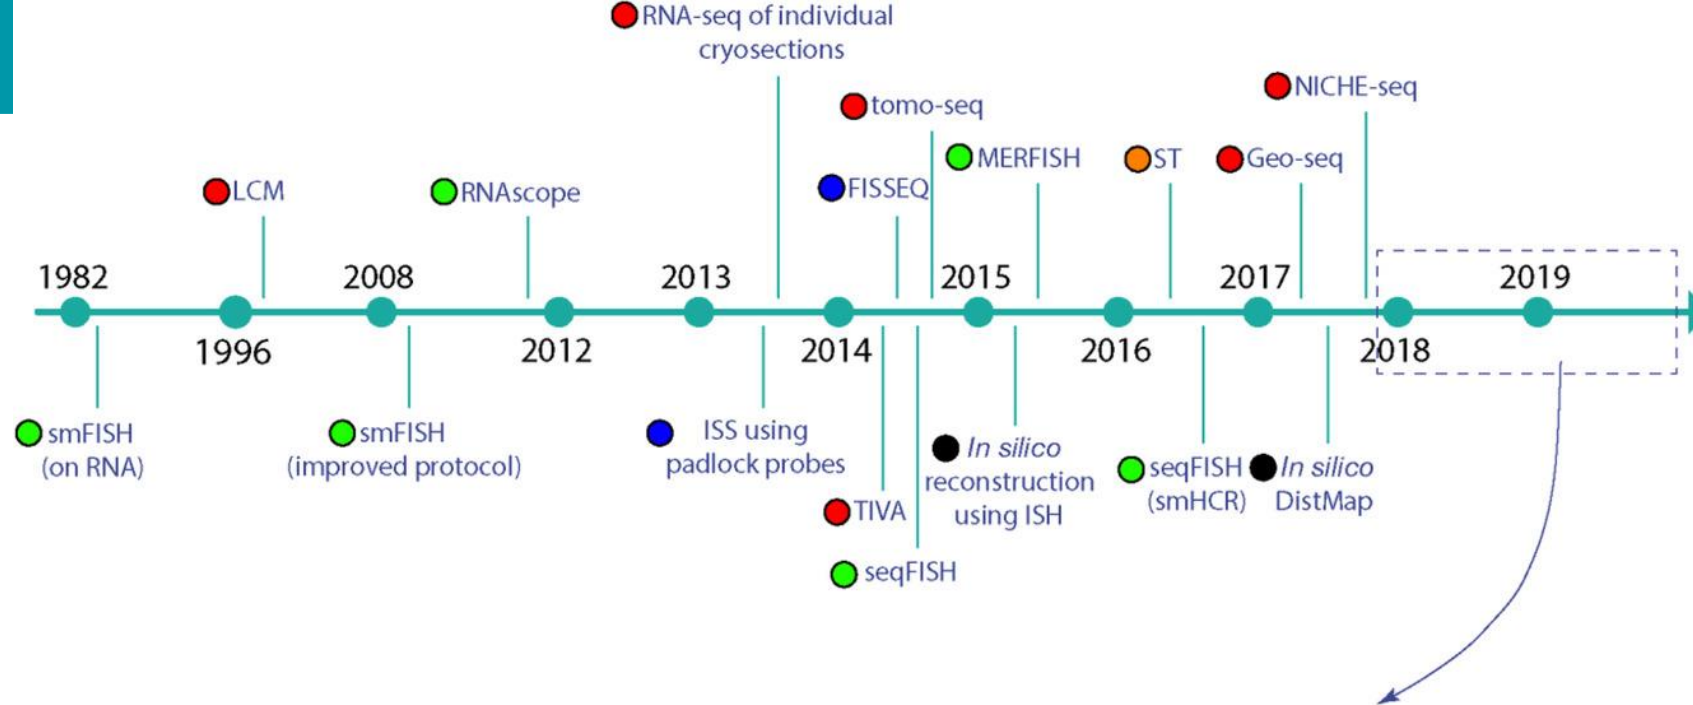

- Gene A is high
- Gene B is low
- Gene C isn't expressed
- Gene D is high

• (one data point per gene per sample)

(many data points mapped to location per gene per sample)

## Cold Spring Harbour Laboratory

# FISSEQ

- FISSEQ = fluorescent in situ RNA sequencing
- Published in Science & Nature Methods
- Not commercialised – developed by Je Lee & George Church

# 10X Visium

<https://onlinelibrary.wiley.com/doi/epdf/10.1002/bies.201900221>

# 10X Visium

Tissue Section

Spatial Transcriptomic Map

Visualize Expression of any mRNA

H&E

ACTB

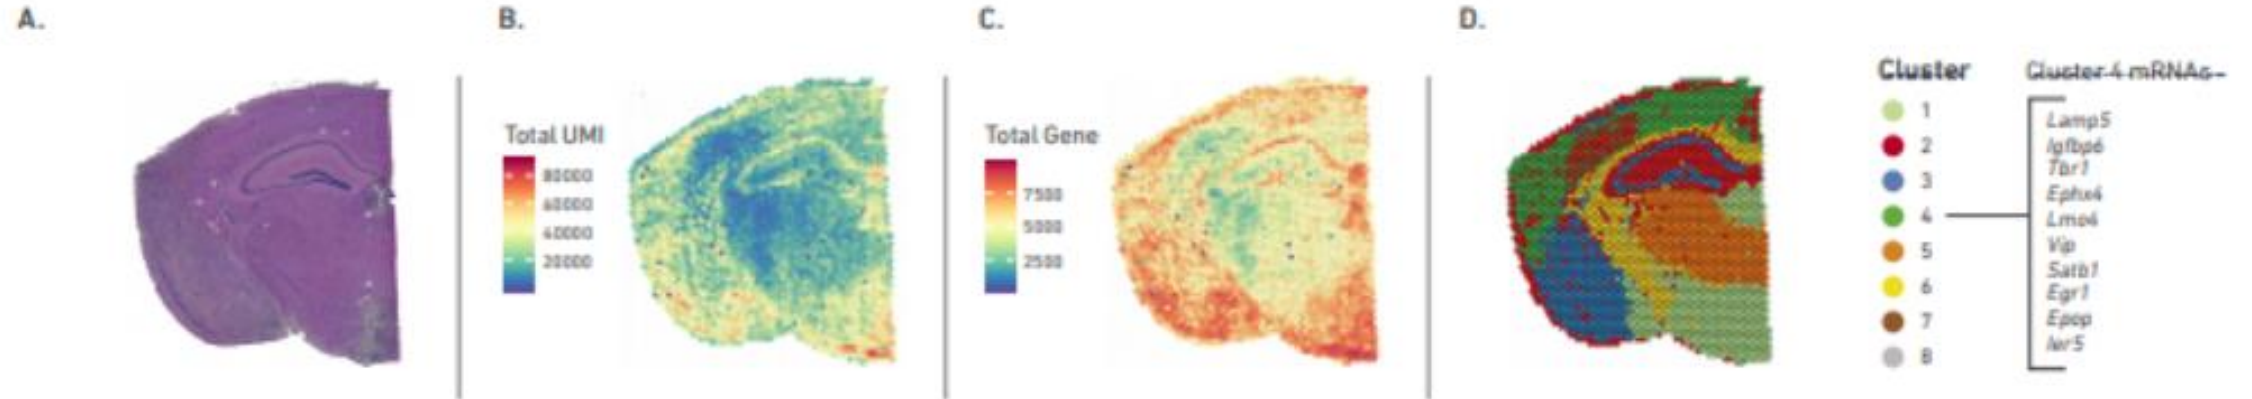

PTEN

MYC

# 10X Visium – latest version, more dots, analysis pipeline:

Visium with H&E: Use H&E staining for morphological context:

# So you've decided you want to use Spatial Transcriptomics.

## What next?

- Usual considerations: cost, equipment needed, time etc.
- Sample type (live cells / fixed cells / frozen sections / FFPE)
- Sample type (auto fluorescence?)
- Targeted or transcriptome-wide?
- Spatial resolution: anatomical features? Subcellular?
- Has it been demonstrated outside of originator's lab?

# Considerations when choosing a method:

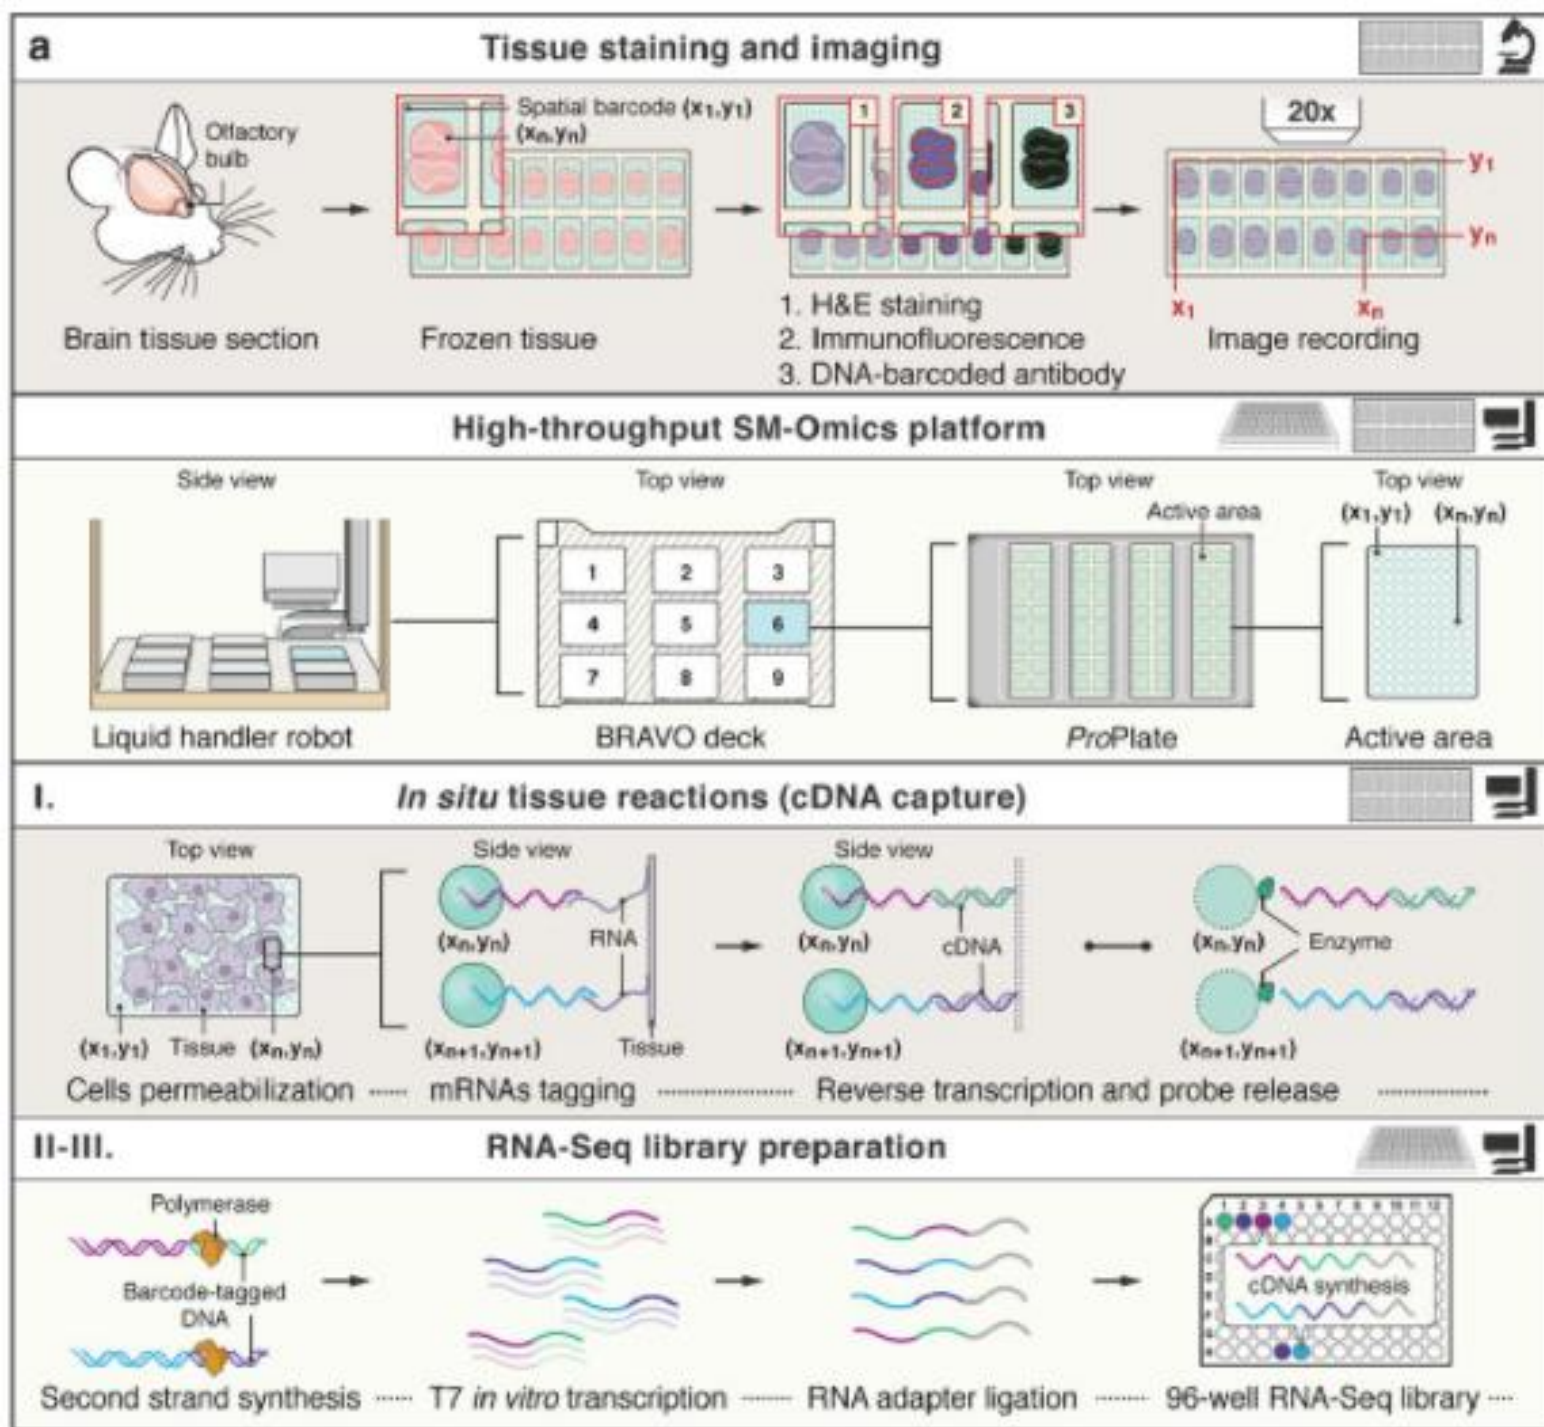

Method	Sample type	Spatial resolution	Approach	Detection efficiency	Advantages/Drawbacks	Demonstrated outside of originators lab
FISSEQ	Fresh-frozen or FFPE <sup>[60]</sup>	Subcellular	Transcriptome-wide	<0.005% <sup>[61]</sup>	+ Non-targeted – Low sensitivity – Limited field of view	No
ST/10X Visium	Fresh-frozen	Anatomical features of 100 μm/55 μm	Transcriptome-wide	ST: 6.9% <sup>[41]</sup> 10X: higher than ST	+ Whole-mRNA analysis – Barcoded regions contain multiple cells	Yes
Nanostring GeoM	Fresh-frozen and FFPE	Custom down to 10μm	Targeted	Not specified	+ FFPE compatible – Choose between protein/RNA profiling – High level of automation – Low sensitivity when using smaller ROIs – Require manual choice of regions	Yes

Spatially Resolved Transcriptomes—Next Generation Tools for Tissue Exploration

# Future of Spatial Transcriptomics

- cBioportal/Cancertool for spatial datasets?
- Larger cohorts – spatial equivalent of TCGA?
- Automated spatial transcriptomics?
- High content spatial transcriptomics?
- Combining with spatial proteomics?
- Combining with spatial metabolomics?
- Combining with spatial epigenomics?

“Here, we advance the application of ST at scale, by presenting Spatial Multiomics (SM-Omics) as a fully automated high-throughput platform for combined and spatially resolved transcriptomics and antibody-based proteomics.”
